

A PROPOSAL FOR [ORGANIZATION NAME]

Every child leaves with the right adult. *Every time.*

Shmeera is a check-in and check-out system built for children's ministry and school drop-off/pickup alike — where a pickup is never approved by one tap, medical notes stay private to the room they belong to, and every family has a direct line to their child during the day.

— THE DROP-OFF-LINE PROBLEM

The clipboard was never built for this many families.

Most children's ministries and school front offices still run on a paper sign-in sheet and a shared name tag: a volunteer or staff member matches handwriting to a name at pickup, medical notes travel on a sticky note, and there's no record of exactly who released a child, or when, until someone has to reconstruct it from memory after the fact. A parent whose child needs a diaper change or isn't feeling well has no way to reach the room without leaving their seat — or their desk.

None of that is a volunteer problem. It's a paper problem — and it's the exact gap Shmeera closes.

CHECK-IN TABLE, 9:14AM

- ✗ Sign-in sheet, three names deep in a hurry
- ✗ "Which sticker was hers again?"
- ✗ Grandma's here — is she on the list?
- ✗ No way to reach the room mid-service
- ✓ Shmeera: a code, a photo, a second yes

— HOW IT WORKS

One rule underneath everything: a code never checks a child in or out by itself.

Generating a code is the parent's half of the handshake. Someone standing in the room — matching a face to a photo — has to independently say yes. That's true for drop-off, and true again for pickup.

01

Two-sided confirmation

Every check-in and pickup code is generated per session, cryptographically random, and expires on its own — but changes nothing until staff independently accept it.

02

A closed pickup list

Only the guardian, or someone they've explicitly added with a photo, can ever be presented at pickup. A person can also be marked *blocked* — a clear warning, not silence.

03

Scan or type

Staff can scan the parent's QR with the camera already in their pocket, or type the code by hand — either way, the same server-side check runs before anything changes.

04

A room, not a spreadsheet

Staff see a live queue of who's pending, who's checked in, and who's waiting to be picked up — for their room. Admins see every room at once, across the whole building.

05

A direct line to the room

Parents and staff chat for the length of a session. An urgent message that goes unread escalates to an admin automatically — no pager, no walking the halls.

06

A record that holds up

Every check-in, decline, transfer, and mismatched code attempt is timestamped and tied to a staff account — searchable by child, room, or date, for as long as you need it.

07

A code that reaches them, however they need

If a parent isn't looking at their screen, an admin can text and email that session's code directly to them — the same server-side check still runs, this just widens how the code gets to them.

08

Notified, even offline

OS-level push notifications reach staff and parents even when the app itself is closed — a new request doesn't sit waiting for someone to reopen a tab.

Three moments, each with its own confirmation.

DROP-OFF

Parent generates a code

A room is auto-suggested by age. The code and a QR appear instantly — staff see the request the moment it's created, with the child's photo and any medical notes.

DURING SERVICE

The room stays reachable

A quiet chat thread stays open the whole time. Staff can send a quick alert — "needs a diaper change," "please come to the room" — the instant it's needed.

PICKUP

Staff confirm, in person

The presenting adult's name, relationship, and photo appear alongside the code. Staff approve only when both check out — face and code together.

— BUILT FOR A ROOM FULL OF MINORS' DATA

Safety software should be honest about what it holds.

Names, photos, medical notes, and family relationships are treated as what they are — the most sensitive data a church or school handles.

Consent, captured at signup

Every guardian and every staff account explicitly consents before a single record is created — not buried in fine print after the fact.

Medical notes, scoped tightly

Visible only to the staff actually assigned to a child's room during their session — never broadcast to the whole roster.

A vetting gate for staff

Staff accounts require admin approval before they can accept a single check-in, with background-check status tracked per account.

Data you control

A guardian can export or archive their own family's data at any time. Admins set a retention window; nothing lingers by accident.

— RUN ONE CAMPUS, OR A WHOLE NETWORK

Every church, school, or ministry gets its own fully isolated space — on the same platform.

Sign up and your organization becomes its own independent space: your own rooms, your own families, your own staff and audit history — invisible to every other organization on Shmeera, even ones run by the same network. If you coordinate multiple campuses, classrooms, or a family of churches and schools, one dashboard shows you all of them at a glance, without ever mixing their data.
