

A PROPOSAL FOR [ CHURCH / MINISTRY NAME ]

# Every child leaves with the right adult. *Every time.*

Shmeera is a check-in and check-out system built for children's ministry — where a pickup is never approved by one tap, medical notes stay private to the room they belong to, and every family has a direct line to their child during the service.

## — THE SUNDAY-MORNING PROBLEM

# The clipboard was never built for this many families.

Most children's ministries still run on a paper sign-in sheet and a shared name tag: a volunteer matches handwriting to a name at pickup, medical notes travel on a sticky note, and there's no record of exactly who released a child, or when, until someone has to reconstruct it from memory after the fact. A parent whose child needs a diaper change or isn't feeling well has no way to reach the room without leaving their seat mid-service.

None of that is a volunteer problem. It's a paper problem — and it's the exact gap Shmeera closes.

### CHECK-IN TABLE, 9:14AM

- ✗ Sign-in sheet, three names deep in a hurry
- ✗ "Which sticker was hers again?"
- ✗ Grandma's here — is she on the list?
- ✗ No way to reach the room mid-service
- ✓ Shmeera: a code, a photo, a second yes

## — HOW IT WORKS

# One rule underneath everything: a code never checks a child in or out by itself.

Generating a code is the parent's half of the handshake. Someone standing in the room — matching a face to a photo — has to independently say yes. That's true for drop-off, and true again for pickup.

01

## Two-sided confirmation

Every check-in and pickup code is generated per session, cryptographically random, and expires on its own — but changes nothing until a volunteer or staff member independently accepts it.

02

## A closed pickup list

Only the guardian, or someone they've explicitly added with a photo, can ever be presented at pickup. A person can also be marked *blocked* — a clear warning, not silence.

03

## Scan or type

Volunteers can scan the parent's QR with the camera already in their pocket, or type the code by hand — either way, the same server-side check runs before anything changes.

04

## A room, not a spreadsheet

Volunteers see a live queue of who's pending, who's checked in, and who's waiting to be picked up — for their room. Admins see every room at once, across the whole building.

05

### **A direct line to the room**

Parents and staff chat for the length of the service. An urgent message that goes unread escalates to an admin automatically — no pager, no walking the halls.

06

### **A record that holds up**

Every check-in, decline, transfer, and mismatched code attempt is timestamped and tied to a volunteer's account — searchable by child, room, or date, for as long as you need it.

07

### **A code that reaches them, however they need**

If a parent isn't looking at their screen, an admin can text and email that session's code directly to them — the same server-side check still runs, this just widens how the code gets to them.

08

### **Notified, even offline**

OS-level push notifications reach volunteers and parents even when the app itself is closed — a new request doesn't sit waiting for someone to reopen a tab mid-worship.

# Three moments, each with its own confirmation.

## DROP-OFF

### **Parent generates a code**

A room is auto-suggested by age. The code and a QR appear instantly — volunteers see the request the moment it's created, with the child's photo and any medical notes.

## DURING SERVICE

### **The room stays reachable**

A quiet chat thread stays open the whole time. Volunteers can send a quick alert — "needs a diaper change," "please come to the room" — the instant it's needed.

## PICKUP

### **Staff confirm, in person**

The presenting adult's name, relationship, and photo appear alongside the code. Volunteers approve only when both check out — face and code together.

# Safety software should be honest about what it holds.

Names, photos, medical notes, and family relationships are treated as what they are — the most sensitive data a ministry handles.

## **Consent, captured at signup**

Every guardian and every volunteer account explicitly consents before a single record is created — not buried in fine print after the fact.

## **Medical notes, scoped tightly**

Visible only to the volunteers actually assigned to a child's room during that service — never broadcast to the whole roster.

## **A vetting gate for volunteers**

Volunteer accounts require admin approval before they can accept a single check-in, with background-check status tracked per account.

## **Data you control**

A guardian can export or archive their own family's data at any time. Admins set a retention window; nothing lingers by accident.

— RUN ONE CAMPUS, OR A WHOLE NETWORK

## Every church or ministry gets its own fully isolated space — on the same platform.

Sign up and your church becomes its own independent organization: your own rooms, your own families, your own volunteers and audit history — invisible to every other ministry on Shmeera, even ones run by the same network. If you coordinate multiple campuses or a family of churches, one dashboard shows you all of them at a glance, without ever mixing their data.
