

A PROPOSAL FOR [SCHOOL NAME]

Every child leaves with the right adult. *Every day.*

Shmeera is a check-in and check-out system built for daily school drop-off and dismissal — where a pickup is never approved by one tap, medical notes stay private to the classroom they belong to, and every family has a direct line to their child during the school day.

— THE DROP-OFF-LINE PROBLEM

The clipboard was never built for this many families, every single day.

Most school front offices still run dismissal on a paper pickup list and a name shouted across the carpool line: a staff member matches a name to a face from memory, medical notes travel on a sticky note in a folder, and there's no record of exactly who released a child, or when, until someone has to reconstruct it after the fact. A parent whose child needs to leave early, or who needs to update who's allowed to collect them today, has no fast way to reach the classroom.

None of that is a staff problem. It's a paper problem — and because it repeats every single school day, it's the exact gap Shmeera closes.

DISMISSAL LINE, 3:14PM

✗ Pickup list, three names deep in a hurry

✗ "Wait, who's on the approved list today?"

✗ Grandpa's here — is he authorized?

✗ No fast way to reach the classroom

✓ Shmeera: a code, a photo, a second yes

— HOW IT WORKS

One rule underneath everything: a code never checks a child in or out by itself.

Generating a code is the parent's half of the handshake. Someone standing in the classroom — matching a face to a photo — has to independently say yes. That's true for morning drop-off, and true again for afternoon dismissal.

01

Two-sided confirmation

Every check-in and pickup code is generated per session, cryptographically random, and expires on its own — but changes nothing until a teacher or staff member independently accepts it.

02

A closed pickup list

Only the guardian, or someone they've explicitly added with a photo, can ever be presented at pickup — a person can also be marked *blocked*, a clear warning rather than silence, which matters for a custody arrangement.

03

Scan or type

Staff can scan the parent's QR with the camera already in their pocket, or type the code by hand — either way, the same server-side check runs before anything changes.

04

A classroom, not a spreadsheet

Staff see a live queue of who's pending, who's checked in, and who's waiting to be picked up — for their classroom. Admins see every classroom at once, across campus.

05

A direct line to the classroom

Parents and staff chat for the length of the school day. An urgent message that goes unread escalates to an admin automatically — no intercom, no walking the halls.

06

A record that holds up

Every check-in, decline, transfer, and mismatched code attempt is timestamped and tied to a staff account — searchable by child, classroom, or date, for as long as you need it.

07

A code that reaches them, however they need

If a parent isn't looking at their screen — say, waiting in the carpool line — an admin can text and email that session's code directly to them, through the same server-side check.

08

Notified, even offline

OS-level push notifications reach staff and parents even when the app itself is closed — a dismissal request doesn't sit waiting for someone to reopen a tab.

Three moments, each with its own confirmation.

MORNING DROP-OFF

Parent generates a code

A classroom is auto-suggested by age or grade. The code and a QR appear instantly — staff see the request the moment it's created, with the child's photo and any medical notes.

DURING THE SCHOOL DAY

The classroom stays reachable

A quiet chat thread stays open the whole day. Staff can send a quick alert — "running a fever," "please call the office" — the instant it's needed.

DISMISSAL / EARLY PICKUP

Staff confirm, in person

The presenting adult's name, relationship, and photo appear alongside the code. Staff approve only when both check out — face and code together.

— BUILT FOR A CLASSROOM FULL OF MINORS' DATA

Safety software should be honest about what it holds.

Names, photos, medical notes, and family relationships are treated as what they are — the most sensitive data a school handles.

Consent, captured at signup

Every guardian and every staff account explicitly consents before a single record is created — not buried in fine print after the fact.

Medical notes, scoped tightly

Visible only to the staff actually assigned to a child's classroom that day — never broadcast to the whole roster.

A vetting gate for staff

Staff accounts require admin approval before they can accept a single check-in, with background-check status tracked per account.

Data you control

A guardian can export or archive their own family's data at any time. Admins set a retention window; nothing lingers by accident.

— RUN ONE CAMPUS, OR A WHOLE DISTRICT

Every school gets its own fully isolated space — on the same platform.

Sign up and your school becomes its own independent organization: your own classrooms, your own families, your own staff and audit history — invisible to every other school on Shmeera, even ones run by the same district. If you coordinate multiple campuses, one dashboard shows you all of them at a glance, without ever mixing their data.
